

SIMPLE CEO PROPOSAL

Vessel Location Tracking on a Map

Use the existing Voyage and Activity process to show where each active vessel was last reported.

Prepared for Management Review

What the system does today

The existing process already records the ports, voyage and activities.

Create Voyage

Enter voyage number, cargo, crew, Port Origin, Port Destination and Current Location.

Add Voyage Status

Open the current operational phase, such as Loading, Sailing or Unloading.

Add Activity

Record the vessel activity and select its current port or location.

Complete Voyage

Close all activities and statuses, then complete the voyage.

PROPOSED CHANGE:

Add a map and coordinates to the same Create Voyage and Add Activity screens.

During Create Voyage: select three locations on the map

Users can search, click the map, use device location, or enter latitude and longitude.

CREATE VOYAGE

Port Origin

Search or select origin port

Port Destination

Search or select destination port

Current Location

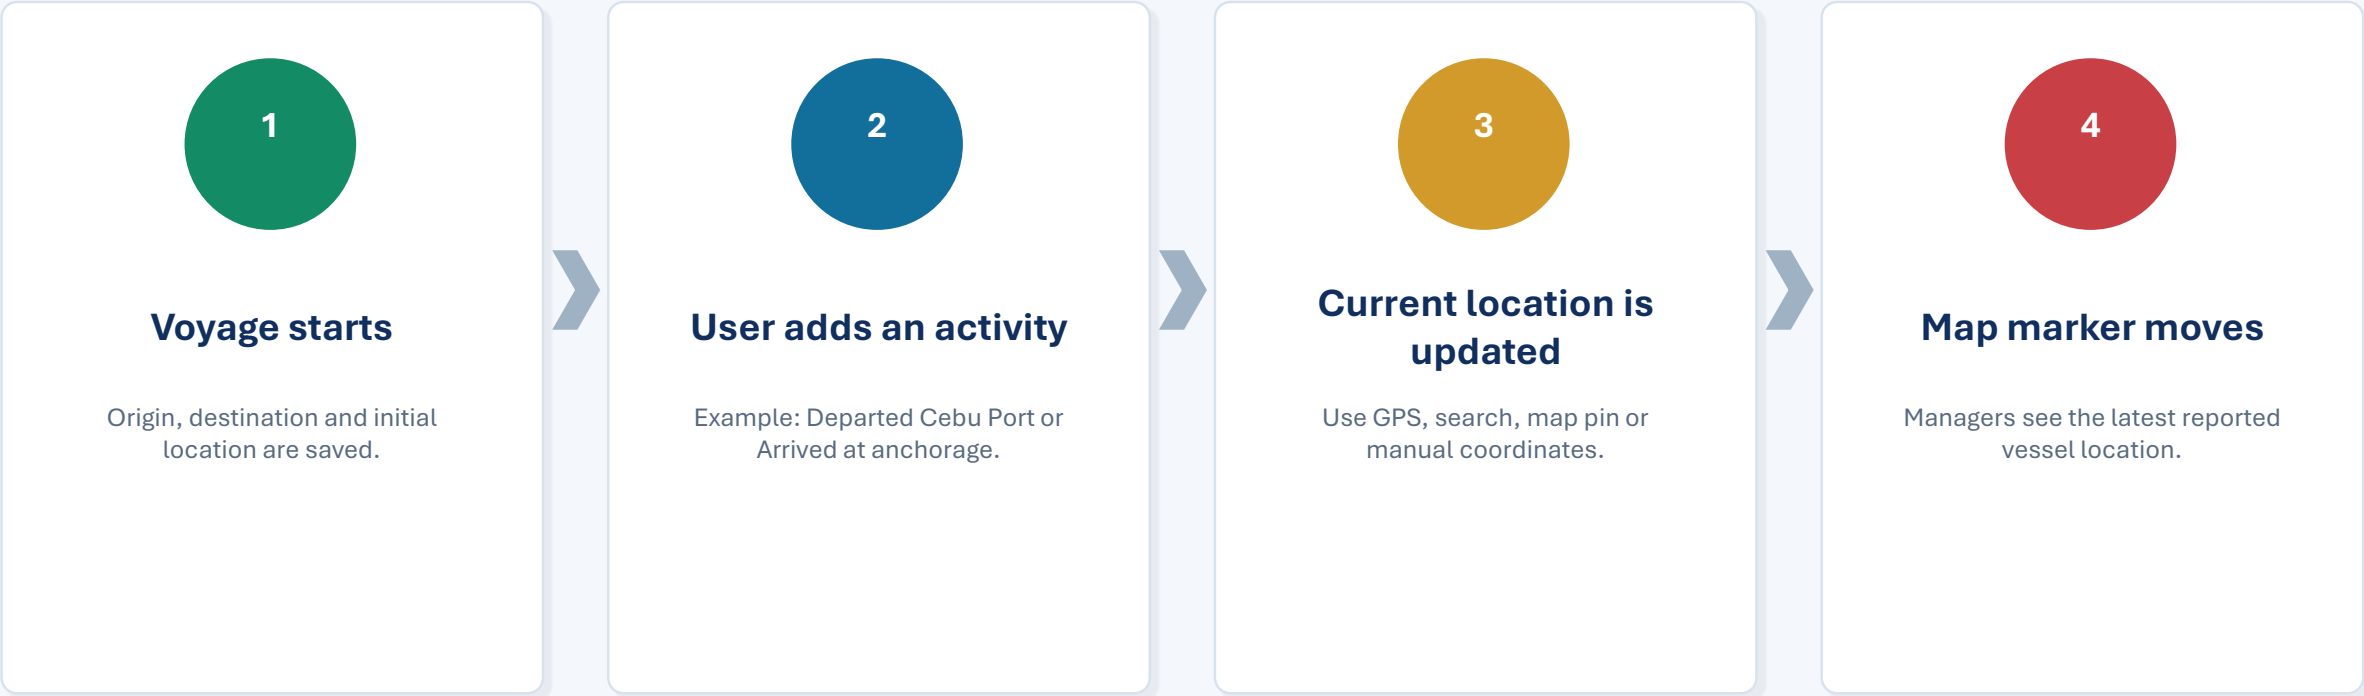

Use GPS, search or drop a map pin

SAVE VOYAGE & MAP POINTS

How the vessel marker moves

The latest location saved from an activity becomes the vessel's current position on the map.

Every update keeps the user, date, time, voyage and activity for history and accountability.

What the Current Voyage Map will look like

Each marker represents one vessel with an active voyage.

Who can use and view it

The proposed map follows the current system permissions and vessel assignments.

System Administrator

View all vessels and manage the feature

Operations / Vessel Manager

View all active vessels and update locations

Technical Manager

View authorized vessels for coordination

Vessel Captain

View and update the assigned vessel only

Executive Viewer

Read-only management map

What “tracking” means in the first version

Management should clearly understand the difference between reported tracking and automatic tracking.

PHASE 1 — PROPOSED NOW

Latest Reported Location

The vessel marker updates when an authorized user saves the current location during voyage creation or an activity update.

- ✓ **Practical first release**
- ✓ **Uses the existing workflow**
- ✓ **Keeps position history**
- ✓ **Lower implementation complexity**

FUTURE OPTION

Automatic Live Tracking

Continuous movement requires integration with an AIS provider or a dedicated GPS device installed on the vessel.

- **Automatic location feed**
- **Additional provider/device cost**
- **Connectivity and integration required**
- **Can be added after Phase 1**

Management approval requested

Proceed with the simple map-enabled design before considering automatic AIS/GPS tracking.

PROPOSED PHASE 1

- ✓ Add a map to Create Voyage.
- ✓ Plot Port Origin, Port Destination and Current Location.
- ✓ Update the vessel marker whenever a new activity location is saved.
- ✓ Show only vessels with an active/current voyage.
- ✓ Pilot the feature before investing in automatic AIS/GPS tracking.

RECOMMENDED DECISION

APPROVE PHASE 1

Next deliverable:

Working map prototype connected to the existing Voyage and Activity screens.
